

Case Study

Flood Protection: **Double Timber Doors**

Client: **Various**

41

Many buildings, both residential and commercial have French doors, patio doors or double door access and often older buildings also have heritage listing.

In these cases, as well as with commercial building requirements, the use of PVC or Composite structures is not acceptable, so to overcome this M3 Floodtec have developed a range of double timber door units with inbuilt flood protection to meet the requirements of BS851188.

Exact duplications of heritage listed double doors have been installed in Grade 1 listed properties in Battersea in a recent flood protection contract matching like for like to the original design - *see top photo*

Similarly for industrial sites a full range of double access openings can be engineered to your exact requirements - *see photo to right*

Manufactured from sustainably engineered Accoya the doors have a guaranteed life of 50 Years.
