Sump & Pump System

The pump and sump system sits below the ground floor to pump out water which enters through the ground. The pump removes water at a faster rate than it can enter.

The benefit to this method of external installation removes excessive upheaval to the property owners and the subsequent costs caused by internal installation, which would otherwise require the joist to be cut out and supported.

External installation allows easy access via a manhole cover, removing the need for large access space through an internal trapdoor and the associated disruption.

- Pumps 525 litres per minute
- Operates on a float switch for piece of mind
- A passive solution meaning no human intervention is required

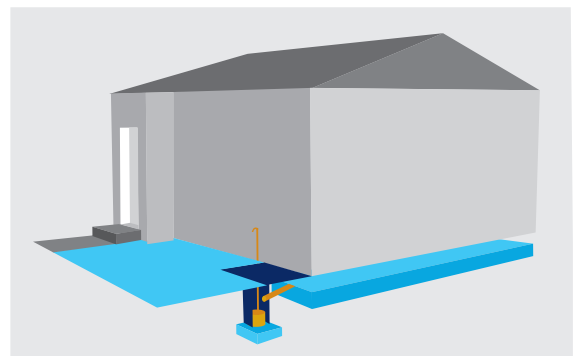

Illustration shows external installation.
